SMART ELECTROMATION TECHNOLOGY

HYBRID SOLAR ROUTER
FRENCH MANUFACTURER

NEW

PATENT PENDING

Smart PV-Router Hybrid

The winning duo

The 1st solar router that controls both the hot-water tank and a battery

Hot-water tank
Takes the water heater off the grid
15 kWh of heat

Smart PV-Router Hybrid
A single router
for the tank and the battery

Battery
Covers the base load
2 to 4 kWh

Controls the battery as an additional output

Two loads off the grid

- Water heater off the grid: the tank heats with your solar surplus instead of grid power
- Base load covered: the battery supplies the home's background consumption
- Guaranteed priority: the battery never drains into the tank, even during off-peak hours

Easy to install, nothing to maintain

- One box fewer: the router acts as the meter required by the battery or inverter
- No server, no cloud, no subscription to keep up
- Less strain on the battery: fewer cycles, longer service life
- Currently compatible: Hoymiles and Marstek batteries, Solis inverters; more under review

Unbeatable storage cost per kWh

Most of the storage is already in your home: your hot-water tank.

15 kWh of heat, in the tank + **2 to 4 kWh** of electricity, in the battery = **17 to 19 kWh** stored with a battery of only 4 kWh
